INTRODUCTION

How to use this course unit

This course unit is not a manual but a combination of theory and workshops with which to learn the programme on a 1-to-1 basis. Every mouse-click and every entry is described in detail, providing you with a teaching resource that lets you learn the basics of the programme by yourself. Each chapter provides explanations, information, and a workshop to practise the functions. To enable the workshops to be completed smoothly, the explanations should be read through very carefully. The order of chapters should not be changed because each workshop builds on the previous one. The programme DVD contains examples stored as an ELITECAD file, enabling problematic places to be reviewed.

Conventions used in this course unit

The start and end of a workshop are marked as follows:

WORKSHOP

Functions are written in block capitals. The corresponding icon also appears for new functions.
FUNCTIONS (BLOCK CAPITALS)

FUNCTIONS

Functions can be accessed directly using icons (buttons). The functions are grouped together in toolbars or in the large tool management.

[Enter]
Function keys on the keyboard appear within square brackets.

Input values (bold)
Input values must be entered using the keyboard. When the text is entered in the input line, it must be confirmed with the [Enter] key.
PREPARATION

In this course unit we start with the project CAD_Object6. First, load the project.

1. Open project

Select the project "CAD_Object6" and confirm with OK.

2. Menu FILE > OPEN
Select the model "Starting Position" and open it.

The opened model should look as follows.
**Materialization**

State materials for objects
A function for materials allocation is offered in the respective parameter screens.

Users can toggle between material mode and colour mode.

Material mode

![Material mode](image)

Colour mode

![Colour mode](image)

**Allocating materials using "drag and drop"**
The other option for allocating materials is using "drag and drop". The material can be dragged and dropped from the Materials editor onto the component in question.

![Allocating materials using "drag and drop"](image)

**Tip**
If you want to allocate the same material to multiple surfaces or objects, etc., there is a multiple allocation function. Drag the material onto a surface as normal. However, instead of releasing it, press the [Shift] key on the keyboard or the "+" sign. Click and hold down the mouse and move it to a different surface before pressing one of the two buttons. This can be repeated any number of times.
WORKSHOP

1. Open the Materials editor.
   Menu View > Window > Material... or use the key combination [Ctrl]+[7].

2. Switch the allocation mode to "Replace".

3. In the Materials editor, double-click to switch to the folder "Boards".

4. Drag and drop the material "Planks001" onto the fence.
5. In the materials editor, switch to the folder above.

6. Double-click on the folder "Timber", drag and drop the material "Maple001" onto the fence.

7. In the Materials editor, switch to the main folders.

8. Double-click on the folder "Surroundings/Grounds/Lawn+Grass", drag the material "Lawn002" and drop it onto the lawn.
9. In the materials editor, switch to the folder above.

10. Double-click on the folder "Surroundings/Grounds/Nutrient Media", drag the material "Loam001" and drop it onto the ground.

11. In the materials editor, switch to the folder above.

12. Double-click in the folder "Surroundings/Grounds/Board lining", and drag and drop the material "Gardendish011" onto the seat.
13. Now add the remaining materials.

- Garage door: Wood/Cladding/Sheeting004
- Street: Surroundings/Grounds/Hard planes/Asphalt002
- Forecourt and sidewalk: Surroundings/Grounds/Hard planes/Asphalt005
- Kerb: Surroundings/Grounds/Hard planes/Asphalt001
- Retaining wall for street: Stone/Concrete/Coarse concrete/Course concrete003
- Retaining wall house: Stone/Concrete/Exposed concrete/Exposed concrete004
- Exterior staircase: Stone/Concrete/Exposed concrete/Exposed concrete002
- Roof: Stone/Tile/Roof tiles/Tile101
- Masonry: Finery/Finery/Finery001
- Tinwork: Metal/Metals/Copper
- Banister: Metal/Metals/Chrome
- Window glass: Glass/Glasses/Pane glass

The model should now look roughly as follows.

TIP
Materials that were accidentally allocated can be deleted by clicking "Material for delete". Depending on the "allocation mode", the material is deleted on the relevant planes.
**VIEW POSITION**

This function is used to observe the 3D object from any point and in any direction. You can finely tune the direction of view using the camera screen below. The design model depiction is automatically set to be in perspective.

---

**WORKSHOP**

1. Activate "Without structure".

![Storeys Manager](image1)

Important: In the ARS version of ELITECAD, you cannot perform any action in Storeys Manager because the model has more than one structure. It does not matter that another storey may be currently active. You can specify the height of the camera in the camera window as you prefer.

2. Image start point

3. Select the function View position.

   *Please click View position or ENTER*

4. Using the capture mode Freehand select the point **P1**.

   *Please enter height of view position*

5. Enter the value **300** into the input line and confirm the value **[Enter]**.

6. Using Capture Freehand mode, select point **P2**.

   *Please enter height for point of vision*

7. Enter the value **300** into the input line and confirm the value **[Enter]**.

---

**WORKSHOP END**
**Camera**

The camera is set in the 4-views window. If the camera screen is open, only the camera symbol can be clicked in CAD. Selecting or manipulating CAD objects is not possible. The depiction of the design model view can be controlled separately. If you right-click in this area, a menu opens where you can select how the design model view should be depicted. This is also true for the other views, as they are interconnected.

**Using the camera in the 4-view window**

Various handles are available, which you can use to manipulate the camera interactively while left-clicking.

- **Modify position of camera**
- **Move camera**
- **Modify direction of camera**
- **Modify opening angle of camera**
1. Set the opening angle in the camera screen to 60.

2. Correct the angle of view so that the model is located roughly in the middle of the model window.

3. Confirm the camera screen with OK.
CREATE DESIGN MODEL VIEW.

This function stores the 3D view angle currently set on your model as model view. In case you wish to change the view angle of a view model, right-click in the view and select "Modify cut-out" from the context menu. You are now "within" the limitation framework and can move around using the centre mouse button and the zoom functions, as usual. The size of the section can also be changed using the handles. The camera position and the section are saved by pressing [Esc] or CANCEL.

WORKSHOP

1. Create new design model view.

2. Enter the name, set the display to solid, switch the background on and switch to material mode.

3. In the material mode, click on the selection button and then on Surroundings.
4. Now switch to the folders Background/Land/ and select the material **Land007**.

5. Next, confirm the screen with OK.

6. Load the model view onto the screen.

7. Save work copy [Ctrl]+[W]

**WORKSHOP END**
**MOVE BACKGROUND IMAGE**

Depending on the camera setting and angle, moving or scaling the background image is required so that it fits correctly. To do so, right-click to open the context menu. Here you will see two menu items for Moving and Scaling. If you also press [Ctrl] when scaling, the image can be modified not to scale.

**WORKSHOP**

1. Right-click in the model window and select Move background image.

    ![Menu Options]

    *Please indicate reference point*

2. Now left-click in the image.

    *Please enter NEW position for alignment point*

3. Set down the background image roughly as shown below.

4. The function remains active so that the action can be repeated until the image is correct. Afterwards, cancel the function with [Esc].

**WORKSHOP END**
**REPETITION**

Now try to define another model view in the interior.

---

**WORKSHOP**

1. Return to the model view and define another viewpoint in the living area.

2. Save this camera as new model view as well. Enter the name **Interior view** and use the same options as described above. Load the view onto the screen and move the background image, too.
3. Allocate materials to the interior view.

- Slab: Wood/Parquet/Parquet block/Oak006
- Stairs: Wood/Parquet/Parquet block/Oak006
- Truss: Wood/Timber/Ash001
- Roofing: Wood/Cladding/Sheeting022
- Oven: Metal/Metals/Alu
- Banister: Metal/Metals/Chrome
- Kitchen worktop: Stone/Quarry stone/Marble/Marble002
- Slab faces for stair exit: Finery/Finery/Finery001

The interior view should now look roughly as follows:
LIGHT SOURCES

Like the camera, the light sources are set in a 4-view window. Control using the right mouse button is the same as with the camera. For each view, the light sources can be switched on or off separately and their intensity individually controlled.

Using the light sources in the 4-view window

Depending on the light type, there are various handles available, which you can use to manipulate the light type interactively by left-clicking on them.

Here is a spotlight, for example:

- Modify position of light source
- Move light source
- Modify direction of light source
- Modify opening angle of light source
1. Load the model view "Exterior view".

2. Open the light parameters, deactivate "Camera light" and "Sun", activate "Front" and modify the following settings for the same light source. Ensure that the light source by which you set the intensity and the shadow resolution is also selected in the list.

**TIP**
Do not set the controller for shadow resolution to an unnecessarily high level, since detailed resolution will also use more internal memory. Gradually raise the slider until you are happy with the result.
3. Confirm the screen with OK.

4. Load the model view "Interior view" onto the screen.

5. Open the light parameters, deactivate "Camera light" and "Sun", activate "Side left" and modify the following settings for the same light source.
6. Right-click in the model window and select the point "Render model".
7. Set the light source with the handles roughly in such a way as shown below and confirm the screen with OK.

8. Switch to solid mode.

9. Save work copy [Ctrl]+[W]
1. Load the model view "Exterior view".

2. Access the screen parameters.

3. During rendering, select the data record "good" and click OK to close the screen.

4. Trigger rendering.

5. The progress is displayed in the information line.
6. The image should now look roughly as follows:

7. Load the model view "Interior view" onto the screen.

8. Access the screen parameters, select the data record "good" and close the screen with OK.

10. The image should now look roughly as follows:

![Image of rendered interior scene]

**TIP**

The rendered image is "frozen" and is no longer automatically up to date. If the model view remains in render mode, it can be brought up to date by clicking "Refresh view".
**EDIT MATERIAL**

All properties that a material displays such as image texture, transparency, mirroring, shine, etc. can be set or modified in the Materials editor. If a material is changed that is stored in the database, a query appears as to whether the change is saved again to the database or whether a new material should be generated. If you click "No", a new material is generated with a name extension and automatically relocated. This new material is only present in this drawing and if you right-click on it, it can be stored to the database (DB).

---

**WORKSHOP**

1. Load the model view "Exterior view".

2. Switch to solid mode.

3. In Materials Manager, right-click on a folder or click on a material and select the point "Edit material by surface".

4. Now left-click on the lawn. The materials editor opens.
5. On the left-hand side, click on the effect "Texture" and under Division change the material width to **200**.
The change in the preview window becomes visible on the right-hand side.

6. Now click on APPLY.
A prompt appears asking you whether or not you wish to save the change directly to your database. Click NO and then close the main screen with OK.

7. Load the model view "Interior view" onto the screen.

8. Switch to solid mode.

9. In Materials Manager, right-click on a folder or click on a material and select the point "Edit material over surface", and then click on the parquet flooring.
10. On the left-hand side, left-click on the name of the material and activate "Mirroring" from the possible effects.

11. On the left-hand side, click on the effect "Mirroring" and under intensity set the controller to 6.

12. Click APPLY, confirm the prompt with NO and then close the main screen with OK.

13. Save work copy [Ctrl]+[W]

WORKSHOP END
**AREA RENDER**

For larger design models, the complete rendering process may take a long time. That is why there is an option to use range rendering to depict a specific range of the drawing as a rendering design model. The active render parameters are taken into account. The rest of the image is preserved in the previous depiction.

The function remains active so you can change the render setting and view the results, until you cancel range rendering using [Esc].

**WORKSHOP**

1. In Materials Manager, right-click on a folder or click on a material and select the point "Edit material over surface", and then click on the glass.

2. On the left-hand side, left-click on the name of the material and activate "Mirroring" from the possible effects.

3. On the left-hand side, click on the effect "Mirroring" and under intensity set the controller to 10.
4. Click APPLY and confirm the prompt with NO.
5. Switch to Area render mode.

6. Click on point P1.

7. Click on point P2.
The relevant area is now shown as rendered.

8. Set the controller in the material editor to 20 and click APPLY.

9. Click again on the points P1 and P2 or on a different section.
10 Repeat until you are happy with the result. Afterwards, cancel area rendering with [Esc] and then close the material editor.
**Radiosity**

Daylight rendering is a process for rendering the energy distribution of atmospheric light in the scene. This energy diffusion enables a basic illumination level as would be found on a cloudy day, which you can combine with other light sources.

If you wish, the result may be saved with the drawing. Menu "Settings > Options > Save/Load > Drawing". This setting is “on” by default. In the CAD_Object6 example file, the setting is “off” for space reasons on the DVD.

---

**WORKSHOP**

1. Load the model view "Exterior view".

![Exterior View](image.png)

2. Trigger rendering.

3. Access screen parameters, adjust the following settings and then close the screen with OK.

![Render parameters](image.png)

4. Refresh view.

![3D View](image.png)
5. The progression is displayed in the information line. Following the radiosity calculation, the system automatically carries on rendering.

6. Since the radiosity calculation works like an additional light source, the ambient light must be reduced. Open the light parameters, confirm the prompt with "Temporarily switch to solid mode" and change the intensity of the ambient light to 25.

7. Close the screen with OK. Rendering will be triggered again.

8. Load the model view "Interior view" onto the screen.

10. Access screen parameters, set the following settings and then close the screen with OK.

11. Refresh view.

12. Open the light parameters, confirm the prompt with "Temporarily switch to solid mode" and change the intensity of the ambient light to 20.

13. Close the screen with OK. Rendering will be triggered again.
**TIP**

When working, it is advisable to use the "preview" depiction and only to use optimal rendering where necessary and for the final image.

**TIP**

After rendering has been completed, the intensity of the result can be adjusted retroactively without the need to run the rendering again. If you reset the slider to "0", the radiosity result will be deleted.
Radiosity Update

Once the radiosity has been rendered once, it is not automatically refreshed when the geometry is modified or if new material is allocated. The daylight rendering process must be manually restarted.

Workshop

1. Load the "model" view onto the screen.

2. Access the menu item "Insert", select "Load into" and confirm the prompt with "to startpoint".

3. Select the template "Parts of Library.d" and open. Confirm the subsequent prompt with OK.

4. Load the model view "Exterior view".
5. Refresh view.

6. As yet the new parts have no radiosity illumination. Right-click in the model window and select the item "Radiosity Update". Radiosity and rendering will be recalculated.

7. Refresh the radiosity for the Interior view as well.

Exterior view

Interior view
If in a plot compilation render images with radiosity are present, the radiosity update can also be carried out in the plot for multiple views. Right-click in the model window and select the item "Radiosity Update".
**VIEW WITH RENDER IMAGE**

Calculated 2D views of your model can also be defined with render images.

---

**WORKSHOP**

1. In views management, select "Front view" from among the model views.

![View Management](image)

2. In Layer management switch the "Surroundings" layer to invisible.

![Layer Management](image)

3. Open the light parameters, deactivate "Camera light" and "Sun", activate "Front" and set the intensity of the ambient light to 30. Close the screen with OK.

![Light Parameters](image)
4. Create new view.

5. Adjust the following settings.

6. Next, open the render parameters on the same screen, adjust the following settings and close the screen by clicking OK.

7. Close the main screen with OK. The view will be calculated.

8. Load the "South façade" view onto the screen.
South façade

The view can continue to be enhanced with 2D library parts.

**EXPLANATION**

**Display**

<table>
<thead>
<tr>
<th>Depiction</th>
<th>Render</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intensity</td>
<td>100 %</td>
</tr>
<tr>
<td>Parameter</td>
<td>good</td>
</tr>
</tbody>
</table>

You can use this button to determine whether, for the view, a solid image or render image is defined or not, in addition to the lines.

**Hidden line**

Only lines are displayed.

**Solid**

The colour surfaces are added to the background of the line display.

**Render**

The render image is added to the background of the line display.
**DEFINE CUT-OUT**

If you right-click in the view, a menu item "Define cut-out" appears or, if one is already present, "Modify cut-out " and "Remove cut-out ".

The function "Define section" determines an area to which the visibility of the view is restricted. Partial areas can therefore be defined from larger views. If you click "Modify section" the handles of the limitation framework become visible on which the section can be changed. Click "Remove section" to delete the limitation framework.

### WORKSHOP

1. Load the "South façade" view onto the screen.

2. Right-click in the view and select the point "Define cut out".

3. Drag the rectangle across P1 to P2.
4. Delete the 4 view lines with the function DELETE SEGMENT. This deletion generates a deletion line (blue) that continues to cover these lines and is not printed out.

5. Refresh view.

6. Save work copy [Ctrl]+[W]
**DEFINE PLOT**

**WORKSHOP**

1. Create new plot.

   Enter a name and the format and confirm with OK.

![New plot view]

2. Set plan edge.

   In the menu click "LAY-OUT > FORMAT FRAME."

![Format frame]

3. INSERT VIEW

   Click on the "Exterior view" and then on OK.

![Insert view]
4. Set the view to the top left.

5. The view is too large. Load the model view "Exterior view".

6. Change the scale to 1:100.

7. Load the plot view onto the screen.
8. PLACE VIEW

Insert the views "Interior view" and "South façade".

9. Align views.

Click on the view in question and position it. The function remains active and can be carried out for as long as required until it is cancelled with [Esc].

10. Save work copy [Ctrl]+[W]

---

**TIP**

In the plot, the render images can also be combined with normal vector plans.
**MODIFY SECTION (PLOT)**

Within the plot it is also possible to work directly in the sub views.

**WORKSHOP**

1. Load the plot view onto the screen.

2. Double-click on the limitation framework of the south façade. The frame is highlighted red in this condition.

3. Right-click in the view and select the point "Modify cut-out".

4. Widen the view using the handles created and align with the others.
5. Update the view within the plot. If need be, execute the radiosity update.

6. To deactivate the view, either left-click outside this view in the plot or click on the name of the plot in views management.
**CALCULATE FINAL IMAGES**

The quality of the images can be adjusted to your requirements. Do not set the quality unnecessarily high while working. Only do so before rendering the final image. Be also advised to lower the quality of the images when editing the project for long periods, and to increase it again when you are finished. The level of quality that can be set depends on your computer and its RAM. The size of your model is also a factor. If an image can no longer be calculated, a message appears on the screen. If this happens, the quality must be lowered. In the CAD_Object6 example file, the quality is set to half of that in the description for space reasons on the DVD.

---

**WORKSHOP**

1. Load the model view "Exterior view". Ensure that the image is rendered.

2. Access screen parameters, modify the following settings and then close the screen with OK.

3. Refresh view. If need be, execute the radiosity update.
4. Do the same for the view "Interior view" as well.

5. For the "South façade" you reach the rendering parameters via the general screen parameters since the view is not a pure rendering. Set the same settings there as well but remain with the "Resolution" for image quality. Next, close both screens with OK.

6. Refresh view. If need be, execute the radiosity update.

7. Save work copy [Ctrl]+[W]
SAVE IMAGE

Rendered model views can be saved as an image file.

WORKSHOP

1. Load the model view "Exterior view". Ensure that the image is rendered.

2. In the menu "File > File exchange" select the point "Write pixel format".

3. The "Write pixel format" screen opens. Enter a file name and confirm it with "Save". The image will be saved in the selected folder as an image file.
4. Do the same for the view "Interior view" as well.

5. The procedure is slightly different for the "South façade". Since the view is not pure rendering and also contains lines, the resolution must be entered manually. Load the view "South façade" onto the screen and from the menu "File > File exchange" select the menu item "Write pixel format". Enter the pixel size as follows:

6. Right-click in the view and select the point "Print preview".

7. Click OK to confirm the screen "Write pixel format". The "Write pixel format" screen opens. Enter a file name and confirm it with "Save". The image will be saved in the selected folder as an image file.
TIP

For "Write bitmap" for normal views, always use the aspect ratio of the image.
PRINT

If colour gradient hatches or transparencies exist in plans, certain printer drivers may not print them as transparent. In this case, the option "Print in highest quality" must be selected in the SETTINGS menu > SYSTEM > CONFIGURATION.

WORKSHOP

1. Load the plot view onto the screen.

2. Click on the PRINT symbol.

3. Print on format size A2:
Select the relevant printer or plotter, select the format under "Properties" and under "Range" select "Format".

4. Print on format size A3:
Select the relevant printer or plotter, select the format under "Properties" and under "Range" select both "Format" and also the "Modify" option.
5. Save the file.
